

## Configuration

### 1. Enable/disable auto update configuration:

```
UPDATE MASTER.APPSETTINGS SET VALUE = 'OFF' WHERE KEY = 'AutoSnapshotUpdate';
```

Change the highlighted value to **ON** to enable auto snapshot update, **OFF** to disable.

### 2. Configure the interval (in hour), at which the pipeline app will check for new snapshots in the MLC's SFTP server :

```
UPDATE MASTER.APPSETTINGS SET VALUE = 24 WHERE KEY = 'SnapshotCheckIntervalInHours';
```

### 3. Reload one or more tables (in case of load failure or accidental deletion):

```
UPDATE MASTER.APPSETTINGS SET VALUE = 'SNAP_20241118.ALTERNATIVE_WORK_TITLES' WHERE KEY = 'TablesToReloadImmediately';
```

Put table name in the following format: <schema name>.<table name>. To reload multiple tables, use comma separated table names like below:

```
UPDATE MASTER.APPSETTINGS SET VALUE = 'SNAP_20241118.RECORDINGS,SNAP_20241118.ALTERNATIVE_WORK_TITLES' WHERE KEY = 'TablesToReloadImmediately';
```

The app will reload the two tables and reset the VALUE to **NULL** once the reload is done. Note: the app will wait till the configured hours in the **SnapshotCheckIntervalInHours** setting shown in step 2, before starting the reload.

### 4. Remove entries from APPLOG, in case of an accidental schema deletion:

```
DELETE FROM MASTER.APPLOG WHERE SCHEMA_NM = 'SNAP_20231213';
```
